[egraber /Users % 
[egraber /Users % 
[egraber /Users % 
[egraber /Users %  python --version
Python 3.11.5
[egraber /Users %  
```

n.b. after most updates, it is necessary to open up a new terminal!

Strongly recommend opening a new tab so that old information can be referenced if needed

## → Install latest python

- ◆ <https://docs.python-guide.org/starting/installation/>
- ◆ Windows, <https://www.python.org/downloads/windows/>
  - If you need to uninstall the windows microsoft store version....check this:  
<https://learn.microsoft.com/en-us/hololens/holographic-store-apps>
- ◆ macOS
  - get package manager homebrew - <https://brew.sh/>
  - Add brew to \$PATH by updating your shell config file (.zshrc)
    - usually brew is at /opt/homebrew/bin/brew
  - e.g. check out this example: <https://mac.install.guide/homebrew/3.html>
  - `brew install python`
- ◆ Add python to \$PATH, or remap `python3` to `python`

## → Essential

- ◆ Please make sure that when you type `python --version` in the terminal, you have python3

## → Integrated Development Environment - VS Code

→ Install vscode - <https://code.visualstudio.com/>

→ Make VS Code accessible in the terminal

### ◆ macOS

- open command palette [⌘ shift P] type path
- Add vscode to \$PATH

### ◆ Windows, ref this:

[https://code.visualstudio.com/docs/editor/command-line#\\_launching-from-command-line](https://code.visualstudio.com/docs/editor/command-line#_launching-from-command-line)

→ Add extensions - <https://code.visualstudio.com/docs/introvideos/extend>

### ◆ ms-python extension (n.b. This extension is not the same as python itself!)

<https://marketplace.visualstudio.com/items?itemName=ms-python.python>

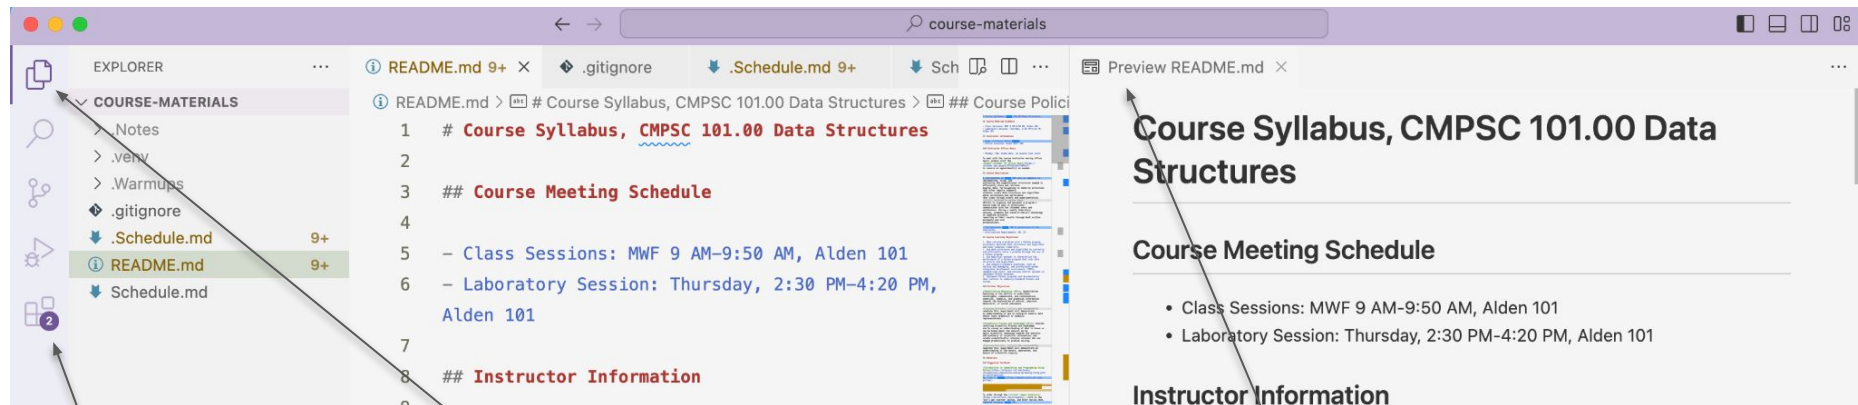

### ◆ any linting extension, eg pylint, flake8, ruff

### ◆ markdown linter is essential

### ◆ consider others to taste:

- spell checking
- indentation rainbow

### ◆ n.b. extensions can be turned off and on

extension  
manager

file explorer

Markdown  
preview

## → SSH keys

- ◆ in the terminal, type: `ssh-keygen -t ed25519`
  - Hit enter to use default location in `~/.ssh`
  - Make a passphrase that you will remember!

## → Add SSH key to GitHub -

<https://proactiveprogrammers.com/proactive-skills/technical-skills/using-git/>

## → Verify your key is working by cloning something, you don't have to change any code

- ◆ e.g. gradebook: [https://classroom.github.com/a/WiBuT\\_qZ](https://classroom.github.com/a/WiBuT_qZ)
- ◆ eg. course-materials repo

```
>> cd Documents
>> mkdir cmpsc101-spring2024
>> cd cmpsc101-spring2024
>> git clone
git@github.com:allegHENY-college-cmpsc-101-spring-2024/course-materials.git
>> git clone
```

## → Get poetry - <https://python-poetry.org/docs/#installing-with-pipx>

### ◆ macOS

- first, you need to get pipx
  - brew install pipx
- then get poetry
  - `pipx install poetry`

### ◆ Windows (ref: <https://python.land/virtual-environments/pipx>)

- `pip install --user pipx`
- 
- You may get a warning about pipx not being in your PATH. If that happens, first cd to the installation location of pipx and then run this:
- 
- `pipx ensurepath`
- `pipx install poetry`

### ◆ Add poetry to \$PATH

- If you used pipx, then `pipx ensurepath`

## → GatorGrade -

<https://proactiveprogrammers.com/proactive-skills/technical-skills/using-gatorgrader/>

- ### ◆ pipx install gatorgrade

# Pro Tips

## Terminal and other

Tab completion

arrow up/down

ctrl c

>> pwd

>> cd ..

>> ls

>> mkdir

## VS Code and most text editors including google docs

cmd arrow left/right

cmd delete

opt delete

cmd z

cmd shift z

cmd f

cmd /

## windows version

ctrl arrow left/right

ctrl delete

opt delete

ctrl z

ctrl y

ctrl f

ctrl /

# Try this, one line at a time

```
poetry --version
```

```
python --version
```

```
gatorgrade --help
```

```
code --version
```

```
cd ~/Documents/cmpsc101-spring2024/course-materials
```

```
code .
```
